VulnScan

Security Assessment

D

Poor — Score 52/100

Website	vulnscan.tech
Date	March 15, 2026
Report ID	VS-QS-20260315-1081

What We Found

We scanned **vulnscan.tech** and found **8 security issues** that need attention.

■ 2 serious issues found

These should be fixed as soon as possible to protect your website and your customers.

6	8	D
PAGES FOUND	ISSUES	GRADE

Level	Count	What It Means
■ CRITICAL	0	None found ✓
■ HIGH	2	Attackers can exploit these easily
■ MEDIUM	4	Should be fixed soon
■ LOW	1	Minor issues to review
■ INFO	1	Good to know

Your Security Issues

Below is each issue we found, what it means for your business, and which security standards it violates.

HIGH #1: Missing Content-Security-Policy Header

CWE-1021 | A05:2021 — Security Misconfiguration | Score: **6.1/10**

Where: https://vulnscan.tech

Your website doesn't have a Content-Security-Policy header. This means attackers could inject malicious scripts that steal your customers' data, passwords, and credit card information.

Why this matters: Cross-site scripting (XSS) attacks can steal customer credentials, inject malware, and deface your website. Average breach cost: $180,000 for small businesses.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

HIGH #2: Missing X-Frame-Options Header

CWE-1021 | A05:2021 — Security Misconfiguration | Score: **5.4/10**

Where: https://vulnscan.tech

Your website can be embedded inside other websites. Attackers use this to create fake pages that trick your visitors into clicking buttons that transfer money or change their account settings.

Why this matters: Clickjacking attacks trick users into clicking hidden buttons — transferring funds, changing passwords, or granting access without knowing.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

MEDIUM #3: Missing HSTS (Strict-Transport-Security)

CWE-319 | **A02:2021 — Cryptographic Failures** | Score: **5.9/10**

Where: https://vulnscan.tech

Your website doesn't force secure connections. Attackers on public WiFi can intercept your visitors' traffic and steal passwords, including payment information.

Why this matters: SSL stripping attacks can intercept login credentials and payment data in transit. PCI DSS requires HSTS for payment processing.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

MEDIUM #4: Missing Permissions-Policy Header

CWE-16 | **A05:2021 — Security Misconfiguration** | Score: **4.3/10**

Where: https://vulnscan.tech

Your website doesn't restrict access to device features like camera, microphone, and location. If any script gets injected, it could access these without your visitors knowing.

Why this matters: Without restrictions, injected scripts can access camera, microphone, and location — a GDPR/privacy liability.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

MEDIUM #5: Missing SPF Email Authentication

CWE-290 | A07:2021 — Identification and Authentication Failures | Score: **5.3/10**

Where: vulnscan.tech

Anyone can send emails pretending to be from your domain. Scammers could email your customers from your address and trick them into giving up personal information.

Why this matters: Without SPF, anyone can send emails as your domain. Phishing attacks from your domain destroy customer trust and can trigger legal liability.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

MEDIUM #6: Missing DMARC Email Policy

CWE-290 | A07:2021 — Identification and Authentication Failures | Score: **5.3/10**

Where: vulnscan.tech

Your domain has no email protection policy. This means fake emails sent from your domain won't be blocked, making it easy for scammers to impersonate your business.

Why this matters: No DMARC = no email spoofing protection. Attackers impersonate your brand to phish your customers, partners, and employees.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

LOW #7: Server Technology Disclosed

CWE-200 | A05:2021 — Security Misconfiguration | Score: **3.7/10**

Where: https://vulnscan.tech

Your server reveals what software it runs. Attackers use this information to look up known weaknesses in your specific software versions.

Why this matters: Exposed tech stack helps attackers find known CVEs for your exact versions. Automated scanners target these fingerprints.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

INFO #8: DNS CAA Record Missing

CWE-295 | A02:2021 — Cryptographic Failures | Score: **3.1/10**

Where: vulnscan.tech

Any certificate authority in the world can issue SSL certificates for your domain. Adding a CAA record limits this to only your chosen provider.

Why this matters: Without CAA records, any CA worldwide can issue certificates for your domain, enabling man-in-the-middle attacks.

> ■ **How to fix this → Included in Deep Scan ($199)**
> The Deep Scan report gives you step-by-step instructions to fix this issue, written for your exact technology.

What's at Stake

Your website has 8 known security gaps. Here's what could happen if they're not fixed:

■ Financial Loss
Data breaches cost small businesses $120,000–$200,000 on average.

■ Customer Trust
One breach can destroy years of built reputation overnight.

■■ Legal Liability
Compliance violations carry $50,000+ in fines (GDPR, PCI DSS).

■ Business Disruption
Hacked websites go offline, losing revenue every hour.

What the Deep Scan Includes

The Deep Scan takes everything in this report and goes **much deeper**. Here's exactly what you get for **$199**:

■ Step-by-Step Fix Instructions

For every issue found, you get exact commands and code to fix it — written for your specific technology (Apache, Nginx, WordPress, etc). No guessing, no Googling. Just copy, paste, and your site is secure.

■ OWASP Top 10 Compliance Matrix

We map every finding to the OWASP Top 10 — the global standard for web security. See exactly which categories you pass or fail. Required by most enterprise clients. Reference: https://owasp.org/www-project-top-ten/

■ PCI DSS / SOC 2 / GDPR Compliance Check

If you handle payments, customer data, or serve EU customers, you need compliance. We check your site against PCI DSS, SOC 2, and GDPR requirements and tell you exactly what's missing.

■ Full Code-Level Remediation Playbook

Before/after code examples for every issue. Your developer can implement all fixes in hours, not weeks. Each fix is verified against the NIST National Vulnerability Database. Reference: https://nvd.nist.gov/

■ Board-Ready Executive Summary

A polished 1-page summary you can hand to your board, investors, or clients. Shows risk level, remediation progress, and industry benchmarking.

■ SSL/TLS Deep Audit

Complete cipher suite analysis, certificate chain validation, protocol support matrix, and HSTS preload status check.

■ Priority Email Support

Got questions about your report? We respond within 24 hours with expert guidance.

Quick Scan vs Deep Scan

See exactly what you get with each plan:

Feature	Quick Scan ($49)	Deep Scan ($199)
Security issues identified	■ Yes	■ Yes
Risk score and grade	■ Yes	■ Yes
NVD/CWE citations	■ Yes	■ Yes
Business impact explained	■ Yes	■ Yes
Step-by-step fix instructions	■ No	■ Yes
Code-level fixes (copy-paste)	■ No	■ Yes
OWASP Top 10 mapping	■ No	■ Yes
PCI/SOC 2/GDPR compliance	■ No	■ Yes
Executive summary	■ No	■ Yes
SSL/TLS deep audit	■ No	■ Yes
Priority support	■ No	■ Yes

Security consultants charge **$3,000–$5,000** for this level of assessment.

Verification Standards

Every finding in this report and the Deep Scan is verified against the following national and international security databases:

■ NIST National Vulnerability Database (NVD)

The U.S. government's official repository of security vulnerabilities. Contains 200,000+ entries with severity scores and technical details.

https://nvd.nist.gov/

■ MITRE CWE (Common Weakness Enumeration)

The industry standard list of software and hardware weaknesses. Every finding in your report is mapped to a CWE category.

https://cwe.mitre.org/

■ OWASP Top 10 (2021)

The world's most widely recognized web application security standard. Used by banks, governments, and Fortune 500 companies to evaluate security.

https://owasp.org/www-project-top-ten/

■ CVSS (Common Vulnerability Scoring System)

The universal severity scoring system used by security professionals worldwide. Each finding includes a CVSS score from 0-10 to help you prioritize fixes.

https://www.first.org/cvss/

■ CVE (Common Vulnerabilities and Exposures)

Maintained by MITRE Corporation. Each publicly known vulnerability gets a unique CVE ID that is tracked globally by security teams.

https://cve.mitre.org/

The Deep Scan ($199) includes direct links to the exact NVD and OWASP entries for every vulnerability found, so you can verify every finding independently.
